Space Weather Forecast

Issued on Thursday, 09 February 2023 at 13:13 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

Space Weather Forecast Headline: Further Moderate flares likely.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Moderate with several Moderate class flares observed, the largest of which was from a new emerging region on the southwest limb. A further large region is present near centre disc in the northern hemisphere and this has also been producing Moderate class flares. There are a total of seven numbered and two unnumbered sunspots on the visible disc. No Earth-directed CMEs have been observed.

Solar Wind / Geomagnetic Activity: Solar winds are elevated at 500-600 km/s with Earth in the fast wind originating from a couple of coronal holes. The magnetic field remained Weak to briefly Moderate, and whilst the north-south component Bz, was variable, it was more generally southward pointed. Geomagnetic activity was Quiet to Unsettled with one Active interval observed.

Energetic Particles / Solar Radiation: The count rate of energetic particles is at Background levels with no solar radiation storms observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Low to Moderate solar activity is predicted over the coming days, with a slight chance of High levels being reached, mainly owing to the largest sunspots, which are now in evidence.

Solar Wind / Geomagnetic Activity: CMEs which left the Sun on the 5th and 7th, while forecast to miss the Earth, give a low chance of glancing interactions through much of the period. Otherwise, ongoing elevated solar winds due to recent coronal hole fast winds are forecast to gradually decline. Quiet to Unsettled geomagnetic activity is expected with a chance of isolated Active intervals. There is a very slight chance of G1/Minor storms.

Energetic Particles / Solar Radiation: The count rate of energetic particles is expected to remain at background, but there is a slight chance of this increasing towards the S1/Minor radiation storm level in response to any significant flares that occur.

Met Office

Space Weather Forecast

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	5	5	5	5
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	Yes	70	70	60	60
Very Active	R3 to R5 X	No	10	10	20	20

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	10	10	10	20
Very Active	≥ S3 *	No	1	1	1	1

* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
